

SECURITY AND PRIVACY WHITE PAPER

Poly Edge B Series Devices

Part 3833-87725-001

Version 01

October 2021

Introduction

This white paper addresses security and privacy related information regarding Poly Voice OS-Lite (PVOS-L) for Poly Edge B Series devices.

This paper also describes the security features and access controls in Poly’s processing of personally identifiable information or personal data (“personal data”) and customer data in connection with the provisioning and delivery of Poly Edge B Series devices, including the location and transfers of personal and other customer data.

Poly will use such data in a manner consistent with the [Poly Privacy Policy](#), and this white paper which may be updated from time to time. This white paper is supplemental to the [Poly Privacy Policy](#). The most current version of this white paper will be available on [Poly’s website](#).

Poly Edge B Series devices use PVOS-L, the telecommunications industry’s most powerful and flexible SIP software for VoIP-enabled devices. Poly’s software and award-winning product design are compatible with the broadest range of call control platforms and support highly robust provisioning and device management solutions, employing the broadest SIP feature set.

Optional Integrations Available

Poly Edge B Series devices are capable of being configured to integrate with the following optional Poly products and services:

Optional configuration	Provisioning	Other Services
Poly Lens	Yes	Device Management, Analysis & Reporting
Zero Touch (ZT)	Yes	Not applicable
PDMS-SP (cloud service)	Yes	Device Management & Monitoring, Analysis and Reporting

For security and privacy details related to these optional products and services, please refer to [here](#).

Security at Poly

Security is always a critical consideration for all Poly products and services. Poly’s Information Security Management System (ISMS) has achieved ISO 27001:2013 certification. ISO/IEC 27001 is the most widely accepted international standard for information security best practices and you can be reassured that Poly has established and implemented best-practice information security processes.

Product security at Poly is managed through the Poly Security Office (PSO), which oversees secure software development standards and guidelines.

The Poly Product Security Standards align with NIST Special Publication 800-53, ISO/IEC 27001:2013, and OWASP for application security. Guidelines, standards, and policies are implemented to provide our developers with industry approved methods for adhering to the Poly Product Security Standards.

Secure Software Development Life Cycle

Poly follows a secure software development life cycle (S-SDLC) with an emphasis on security throughout the product development processes. Every phase of development process ensures security by establishing security requirements alongside functional requirements as part of initial design. Architecture reviews, code reviews, internal penetration testing and attack surface analysis are performed to verify the implementation.

The S-SDLC implemented by Poly also includes a significant emphasis on risk analysis and vulnerability management. To increase the security posture of Poly products, a defense-in-depth model is systematically incorporated through layered defenses. The principle of least privilege is always followed. Access is disabled or restricted to system services nonessential to standard operation.

Standards-based Static Application Security Testing (SAST) and patch management are cornerstones of our S-SDLC.

Privacy by Design

Poly implements internal policies and measures based on perceived risks which meet the principles of data protection by design and data protection by default. Such measures consist of minimizing the processing of personal data, anonymizing personal data as soon as possible, transparently documenting the functions, and providing features which enable the data subject to exercise any rights they may have.

When developing, designing, selecting, and using applications, services and products that are based on the processing of personal data or process personal data to fulfill their task, Poly considers the right to data protection with due regard.

Security by Design

Poly follows Security by Design principles throughout our product creation and delivery lifecycle which includes considerations for confidentiality, integrity (data and systems) and availability. These extend to all systems that Poly uses – both on-premises and in the cloud as well as to the development, delivery and support of Poly products, cloud services and managed services.

The foundational principles which serve as the basis of Poly's security practices include:

1. Security is required, not optional
2. Secure by default, Secure by design
3. Defense-in-depth
4. Understand and assess vulnerabilities and threats
5. Security testing and validation
6. Manage, monitor, and maintain security posture
7. End-to-end security: full lifecycle protection

Security Testing

Both static and dynamic vulnerability scanning as well as penetration testing are regularly performed for production releases and against our internal corporate

network by both internal and external test teams.

Patches are evaluated and applied in a timely fashion based on perceived risk as indicated by CVSSv3 scores.

Change Management

A formal change management process is followed by all teams at Poly to minimize any impact on the services provided to the customers. All changes implemented for the Poly CCX and Poly VVX Series go through vigorous quality assurance testing where all functional and security requirements are verified. Once Quality Assurance approves the changes, the changes are pushed to a staging environment for UAT (User Acceptance Testing). Only after final approval from stakeholders, changes are implemented in production. While emergency changes are processed on a much faster timeline, risk is evaluated, and approvals are obtained from stakeholders prior to applying any changes in production.

Data Collection

By default, no product usage data or identifiable personal data is sent to Poly from Poly Edge B Series devices. However, if certain settings are enabled, Poly automatically collects and analyzes product usage data and device data from your Poly Edge B Series devices. Data collected will be used for the purposes identified in the table following this section. To enable data collection, please see the "Device Analytics Settings" section in the "Privacy Guide for Poly Edge B Series".

If you are an individual user of a Poly Edge B Series device, and your employer has purchased and configured the system on your behalf, all the privacy information relating to personal data in this white paper is subject to your employer's privacy policies as controller of such personal data.

Source From Where PI Collected	Categories of PI Collected	Business Purpose for Collection	Disclosed to the following Service Providers
Device Identifier Information	<ul style="list-style-type: none"> • MAC address (primary device and IP peripherals) • Serial number • Device ID • Display name • System name • IP address • Device geolocation data including Time zone 	<ul style="list-style-type: none"> • Internal research (product improvement, development and analytics) • Activities to verify or maintain the quality (Product and Sales Engineering Support) • Detecting security incidents • Debugging 	Azure (Poly Lens) or AWS (PDMS-SP)
Device User Information	<ul style="list-style-type: none"> • SIP username • SIP URI • SIP alias name • Admin and usernames and passwords • System log files • Tenant ID • Site ID • Room ID • Org ID • DNS information • Network Identifiers • Email address • Obi number • PCS account code • PCS number 	<ul style="list-style-type: none"> • Internal research (product improvement, development and analytics) • Activities to verify or maintain the quality (Product and Sales Engineering Support) • Detecting security incidents • Debugging • Short-term, transient use (login) 	Azure (Poly Lens) or AWS (PDMS-SP)

Data Processing

By default, the following list provides some of the information that is processed and stored locally on Poly Edge B Series devices:

- MAC address
- Serial number
- Line name
- IPv4/v6 addresses
- SIP username
- SIP URI
- SIP alias name
- Obi number
- Local contacts

- Admin and usernames
- Admin and user passwords
- Missed/Placed/Received Call lists
- Full Call detail record (CDR)
- System log files
- Directory entries
- Offset GMT

This information is used by the device to provide basic functionality and to enhance the user experience by providing easy access to call history and frequently used contacts.

If you elect to enable the use of the Poly Edge B Series devices with the optional Poly Lens cloud service, your device will send information to that system for the purposes of device management, intelligent insights, and cloud-based services. For details about this data processing, please refer to the Security and Privacy White Paper for Poly Lens located [here](#).

If you elect to use Poly Edge B Series devices with optional products or services such as a Poly device management solution, you can find security and privacy details related to these optional products and services at Poly's website located [here](#).

Purpose of Processing

Information that is processed is used for enhancing the user experience, allowing configuration of settings required for proper delivery of services and easy access to frequently used data.

When configured to use an optional Poly device management solution, the on-premises server or cloud service processes configuration files and their overrides to aid the management of the devices in a given deployment. The server or cloud service may also process device network information, media statistics and device asset information to aid in device analytics, which enables device performance validation and visibility into customer quality of experience and service performance.

How Customer Data is Stored and Protected

In Poly Edge B Series devices, File Based Encryption is supported and by default this feature is enabled. Hence, all the user created data is encrypted before writing onto the device using the 'encrypted key'. Please note that the 'encrypted key' is derived based on the private key data of the device certificate. If the phone is configured to use an optional Poly device management solution or provisioning server, the local contacts file, the device logs, and the call log will be securely uploaded to the solution for backup. There is also a configurable option for the user to stop

uploading of the local contacts and call lists through a menu item accessible from the phone's LCD interface.

Poly supports the use of encryption to protect configuration files and phone calls. For details, please see the Encryption section of the "Privacy Guide for Poly Edge B Series".

For the set of usage data sent to Poly (if enabled), data is stored in a database server that is in an SSAE 16 Type II certified data center in the United States that runs dedicated databases and application servers. When the Poly database server receives data from the customer, it is verified for integrity, processed, and saved in the database.

Data Portability

By default, data is stored securely on the Poly Edge B Series device and is only accessible via the LCD menu or the device's web interface.

When a Poly Edge B Series device is configured to use an optional Poly device management solution, certain information is uploaded using encrypted protocols to the server for backup and storage. This information can be retrieved by the administrator of a Poly device management solution upon request.

Data Deletion and Retention

For clearing of the contacts, there is an option presented to the user under the Basic settings in phone's LCD interface. A user can select this option to clear all the local contacts saved in the phone as well as the call lists and directory entries uploaded to the optional Poly device management solution (if used). Additionally, factory reset is available for resetting back to factory default values. For details, please see the "Right to Erasure" section in the "Privacy Guide for Poly Edge B Series".

For the set of usage data sent to Poly, Poly may retain customer data for as long as needed to provide the customer with any Poly cloud services for which

they have subscribed and for product improvement purposes. When a customer makes a request for deletion to privacy@poly.com, Poly will delete all personal data within 30 days. Other unidentifiable data may continue to be processed.

Poly may “anonymize” personal data in lieu of deletion. The anonymization process is irreversible and includes but is not limited to searching and sanitizing all customer-specific data (e.g., name, site information and IP address) with randomly generated alphanumeric characters.

Secure Deployment

For enterprise customers, Poly Edge B Series devices are deployed and administered on-premises within the customer’s environment. For ITSPs, devices are deployed on-site but administered and provisioned from the cloud outside of the customer’s environment. Deployment options are available to support a variety of scenarios and work environments.

The security of Poly Edge B Series devices is based on optional settings selected during local device setup or when provisioning is configured by the administrator. Please refer to the “Configuring Security Options” and “Recommended Security Settings for Provisioning” sections of the appropriate Poly Edge B Series Administrator Guide for details on best practices for securely deploying the phones. Please refer to the “Privacy Guide for Poly Edge B Series” for configuring privacy related options.

Server Access and Data Security

All customer data sent to a Poly device management solution is encrypted both at rest and in transit using strong cryptography including AES-256 and TLS up to v1.2.

All customer data sent to a Poly device management solution is backed up daily in digital form. Normal access controls of authorized users and data security policies are followed for all backup data. No physical

transport of backup media occurs. The backup data during rest and while in transit is encrypted using AES 256.

Servers are in a secure data center, with only authorized staff members having access. The servers are not directly accessible from outside the data center.

Cryptographic Security

If Poly Edge B Series devices are configured to use an optional Poly device management solution, data transmitted can be encrypted by configuring the device to use TLS protocols as well as strong encryption ciphers for encrypting the packets transmitted over the network.

- Device to Poly Cloud Service
 - HTTPS (443) using TLS 1.1, TLS 1.2 Evaluating services on open TCP/UDP ports
 - Compression: disabled
 - RFC 5746 renegotiation
 - Client-initiated: disabled
 - Ciphers:
 - AES 128/256 (CBC, GCM)
 - Key Exchange: DHE 2048, ECDHE 256
 - SHA, SHA256, SHA384 hashing
 - Poly Cloud Service Device Connections (to local on-premises devices)
 - HTTPS (443) using TLS 1.1, TLS1.2
 - Compression: disabled
 - RFC 5746 renegotiation
 - Client-initiated: disabled
 - Ciphers:
 - AES 128/256 (CBC, GCM), Camellia 128/256 (CBC)
 - Key Exchange: ECDHE 256, RSA
 - SHA, SHA256, SHA384 hashing

For data at rest, please see the section “How

Customer Data is Stored and Protected” later in this white paper.

Authentication

User and administrator accounts can be authenticated either locally on the devices or via the customer’s Active Directory. Users can access Poly Edge B Series devices using the phone’s LCD menu display or the device’s web interface. A separate password is required to be entered to access the administrator settings menu. Access to the device’s web interface requires a username and password to be entered via a web browser. Accessing the device through the LCD menu requires an unlock PIN to be entered manually (when the phone lock feature is enabled).

Security Incident Response

The Poly Security Office (PSO) promptly investigates reported anomalies and suspected security breaches on an enterprise-wide level. You may contact the PSO directly at informationsecurity@Poly.com

The PSO team works proactively with customers, independent security researchers, consultants, industry organizations, and other suppliers to identify possible security issues with Poly products and networks. Poly security advisories and bulletins can be found on the [Poly Security Center](#).

Subprocessors

Poly uses certain subprocessors to assist in providing our products and services. A subprocessor is a third-party data processor who, on behalf of Poly, processes customer data. Prior to engaging a

subprocessor, Poly executes an agreement with the subprocessor that is in accordance with applicable data protection laws.

The subprocessor list [here](#) identifies Poly’s authorized subprocessors and includes their name, purpose, location, and website. For questions, please contact privacy@poly.com.

Prior to engagement, suppliers that may process data on behalf of Poly must undergo a privacy and security assessment. The assessment process is designed to identify deficiencies in privacy practices or security gaps and make recommendations for reduction of risk. Suppliers that cannot meet the security requirements are disqualified.
